

DACS INSTALL

BALTIC and SPLIT

We had a ground floor DJ mixer needing a line to a basement amp rack.

The system was a relatively simple one; tops, sub array and fills halfway up the room.

This was one of the few installs where the system worked well in stereo.

The left and right outputs from the mixer each had a **BALTIC** feeding the two 4 channel amplifiers via two **SPLIT** PCBs so we could easily route them where they needed to go and have trouble free troubleshooting.
