# DACS INSTALL

MIX and RJ45 01/BT

NOTE: **MIX** can mix 2 balanced signals or two unbalanced stereo signals

We wanted to take the audio from a Blue Tooth source and TV audio (via ARC) out to powered speakers.

This would allow the user flexibility with no adjustments or switching – listen to either BT music or TV **OR** simultaneously listen to music while watching TV with the TV sound off or at a low level.

CAT6 from the **RJ45 01/BT** to the Ecler Blue Tooth receiver – audio and power.

This and the TV audio were mixed unbalanced in a **MIX PCB** to a single stereo output.
